

My dream job

By Zhang Kin Kwan, Jacky (6A)

What a wonderful job! To be a physicist is amazing!

I know I will be a wonderful physicist. There are many reasons why I am suitable for this amazing job.

First, I am good at Maths. I think a physicist needs to do a lot of mathematical operations or reflections during their experiments in order to make important discoveries. That is why being good at Maths is important in the world of physics.

Second, I am clever and hard-working, I can get a high score in exams. This is important for me because I need to get into a good secondary school and university, then I can continue my studies and learn about complicated topics. I want to understand how many things work in this world. I will work very hard to find my answers. I am curious and I want to learn about everything related to science. This makes me suitable for the job of a physicist because in the history of physics, most physicists are very clever and curious, just like Einstein or Newton.

Finally, I am suitable to become a physicist because I really love it! I think it is a meaningful job because physics can explain some phenomena in daily life. For example, you walk on the street. Why don't you slip? It is because of friction. Friction creates resistance that keeps you from falling. I want to discover more answers. I hope I will be a physicist one day.

$$E = mc^2$$
$$F = ma$$

a physicist
